

Forum Development Overview

Zhao Hailong | July 27, 2024

MySQL 8.0.39

Explanations

We adopt popular 3 level architecture: web layer, business layer and data access layer.

Web Layer:

- *Web*: defines templates for the forum.
- *Fragments*: defines components for various pages.
- *Interfaces*: provide interfaces for external applications.

Business Layer:

- *Controller*: to control the business logic.

Data Access Layer (DAL):

- *Persistence*: we use Mybatis mapper to implement data access between entities and database tables.

Introduction of other sub modules

- *Common*: to store common files.
- *Config*: to store config files.
